SUMMARY

Software engineer with 4+ years of experience building high-scale distributed systems, event-driven architectures, and data pipelines, with deep roots in Java and cloud-native infrastructure on AWS. Owns outcomes end-to-end, from system design through experimentation, iteration, and production reliability. Ranked as a top Claude Code user company-wide by both usage and efficiency — rethinking the workflow from the ground up around AI: running multiple agents in parallel across work items, moving from detailed spec to PR with minimal hands-on implementation time, then steering each through review and handoff. Became the go-to resource for engineers looking to move beyond surface-level AI use. Thrives in fast-moving, collaborative environments where engineers are expected to own the problem, the solution, and the outcome.

TECHNICAL SKILLS

Languages & Frameworks: Java, Kotlin, Spring Boot, SQL, TypeScript, JavaScript, React Native, React

Persistence: DynamoDB, PostgreSQL, Redis

Cloud & Infrastructure: AWS, Terraform, Docker, Kubernetes, Helm, Datadog, CI/CD, GitHub Actions

Architecture: Microservices, Distributed Systems, REST APIs, GraphQL, Event-driven Architecture, Message Queues, Scaling, Concurrency, Caching, Monitoring

AI Development: Claude Code, Agentic Workflows, Multi-agent Coordination, Prompt Engineering, Prompt Caching

EXPERIENCE

Software Development Engineer II – OfferUp

April 2023 – Present

- Implemented dynamic frequency experimentation for item recommendation notifications, scaling to 250M+ weekly sends that accounted for 20% of DAU and drove a 9% increase in daily active users
- Leading a catalog enrichment initiative integrating real-time LLM inference into the listing lifecycle — designed distributed architecture delivering seller suggestions, product categorization, and taxonomy normalization across 63M+ listings while driving cross-team alignment
- Built end-to-end video infrastructure for listings — REST APIs for video lifecycle management and caching, backed by an event-driven orchestrator — driving 12% more day-0 engagement and a 15% higher sell rate
- Designed and shipped message reactions for the chat platform from concept to production, enforcing a validated reaction set for content safety and boosting user engagements by 0.5%
- Designed and iterated on a community post recommendation notification — building reusable S3 ingestion infrastructure, optimizing pipeline throughput to 7K records/sec, and running Statsig experiments that drove open rates to 10% vs. a 1.5% baseline
- Architected a device heartbeat tracking system and configurable activity gate for real-time notifications, cutting vendor sends from 85M to 30M and reducing notification vendor costs by 95%

Software Development Engineer I – OfferUp

March 2022 – April 2023

- Designed a microservice-based email campaign platform with reusable SQS polling and notification template libraries, delivering 12M emails weekly and driving a 22% increase in email-attributed WAU
- Migrated the meetups service from a legacy Python monolith to a Java Spring Boot microservice, reducing monthly infrastructure costs by 95%

Software Engineer – IBM

August 2021 – March 2022

- Implemented custom predicate support in the rule engine, enabling users to define domain-specific conditional logic for more targeted and flexible rule creation
- Built an API to translate abstract rules into discrete, environment-specific rules, extending the rule engine to support hybrid and on-prem deployment environments
- Developed a structural similarity algorithm to detect redundant rule variants, optimizing storage by identifying and reducing duplicate rules in the engine

EDUCATION

Purdue University – Bachelor of Science, Computer Science

2021
